PROFESSIONAL SUMMARY

QA Automation Engineer with 5 years of experience delivering functional testing and test automation for web, mobile, and API applications. Recently completed an M.S. in Information Science (Machine Learning), with a current focus on Python-based test automation and automation framework development. Professional experience includes Java-based UI, mobile, and API automation, complemented by personal projects that demonstrate modern testing practices, maintainable framework design, and an engineering approach to software quality.

EDUCATION

Master of Science in Information Science, University of Arizona

June 2024 – June 2026

Machine Learning emphasis

- Capstone: Transformer-based American Sign Language (ASL) gesture recognition system — built the end-to-end data pipeline (dataset preparation, feature extraction, and training/evaluation ingestion) in a three-person team.

Master of Technology in Power Electronics, VTU

August 2017 – May 2019

- Completed an industry internship at **Bosch Rexroth**, contributing to industrial automation systems and gaining practical experience with PLC-based control, automation hardware, and industrial engineering workflows.

PROFESSIONAL EXPERIENCE

Quality Engineer — Pepper Square

Bangalore, India | Sep 2022 – Mar 2024

Delivered quality assurance and test automation for web, mobile, and API applications developed for international clients.

Cross-Platform Fitness Application

- Expanded and maintained an existing Appium (Java) automation framework by adding automated coverage for onboarding, authentication, workouts, challenges, geolocation, and HealthKit / Google Fit synchronization across Android and iOS.
- Developed and maintained REST API tests (REST Assured) covering authentication, schema validation, negative scenarios, and core business workflows, while contributing reusable test utilities and improving regression coverage.
- Contributed to the team's automation suite and Jenkins-based CI pipeline, helping reduce full regression execution from approximately two days to under four hours.

Restaurant Online-Ordering Platform

- Automated critical customer ordering workflows — location search, menu navigation, cart, and checkout — supporting cross-browser and mobile-web regression testing (Selenium, Java).

Web Accessibility Audit

- Performed manual accessibility testing against WCAG 2.1 A/AA guidelines using screen readers, keyboard navigation, and automated accessibility tools, validating fixes with developers before release.

Member Technical Staff, Quality — Sharp

Bangalore, India | Sep 2019 – Apr 2022

Performed manual testing and test automation for enterprise web, desktop, and mobile applications supporting Sharp's document-management and business-IoT products.

COCORO OFFICE

- Performed functional and exploratory testing for enterprise web applications, validating authentication, role-based access, device management, reporting, and administrative workflows.
- Expanded and maintained an existing Selenium (Java) automation suite by adding regression coverage for business-critical workflows and contributing reusable test utilities within the team's framework, helping improve regression efficiency as part of a collaborative QA team.

Sharpdesk & Sharpdesk Mobile

- Executed manual functional and regression testing for Windows desktop and mobile applications, validating document management, printer connectivity, synchronization, and end-user workflows.
- Contributed automated regression tests for stable application workflows while working closely with senior QA engineers, gaining hands-on experience in Selenium-based automation and defect investigation.

SELECTED PROJECTS

Flaky Test Detective — github.com/Ak79p/flaky-test-detective

- Built a Python pytest plugin that reruns failed tests in isolated subprocesses, classifies execution history as flaky or consistently failing, and generates CI-consumable JSON reports — measuring test reliability instead of masking failures.
- Applied object-oriented design to separate test collection, execution history, and classification logic, improving maintainability and extensibility; demonstrates pytest hooks, plugin development, and Python packaging.

API Test Framework — github.com/Ak79p/api-test-framework

- Developed a Python API automation framework with layered test organization, reusable fixtures, and CI-ready execution.
- Implemented functional, negative, contract, and performance testing while integrating automated quality checks into the development workflow.

Payment Reliability Lab — github.com/Ak79p/payment-reliability-lab

- Built an integration-testing project that validates payment correctness by verifying database state instead of relying solely on API responses.
- Simulated payment failure scenarios, duplicate requests, and idempotency handling to test application reliability under real-world failure conditions.

Additional projects on github.com/Ak79p.

TECHNICAL SKILLS

Programming: Python (primary), Java

Test Automation: pytest, Playwright, Selenium WebDriver, Appium

API Testing: REST APIs, requests, httpx, REST Assured, Postman

Backend & Databases: FastAPI, PostgreSQL, SQLite, SQL

CI/CD & Development Tools: Git, GitHub, GitHub Actions, Jenkins, Docker

Performance Testing: k6, Locust, Jmeter
